

Malicious-server observability under hidden-policy authorization

Non-IID $\alpha=0.35$; forget ratios 0.25, 0.50, and 1.00; AUC=0.5 denotes random guessing; lower leakage AUC is better.

a Request-type and policy-attribute leakage

b Residual semantic-policy exposure

MA-ABE-FU excess is 0.003; FU repair proxies average 0.326.

Same attack features and partitions are used for all methods.
