

Malicious-server leakage: request type and hidden policy attributes

Non-IID $\alpha=0.35$; forget ratios 0.25, 0.50, and 1.00; points and bars report mean AUC with 95% confidence intervals over all runs.

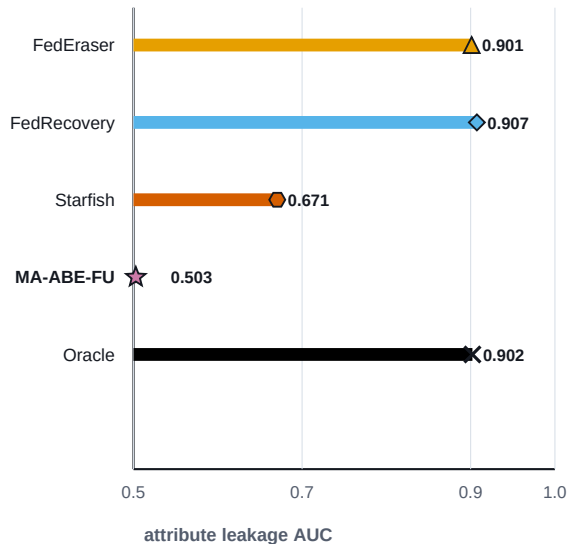

a Observable metadata leakage

random guessing is 0.5

b Attribute-leakage reduction

lower is better

MA-ABE-FU lowers attribute leakage to 0.503; FU repair proxies average 0.826.

The remaining request-type signal is 0.615, indicating that padding reduces but does not completely eliminate timing/queue observability.
